IMPORTANT:
THESE INSTRUCTIONS ARE TO REMAIN WITH THE APPLIANCE INSTRUCTIONS

These instructions are supplementary to the Installation and Operating Instructions supplied with the fireplace and should be kept together. Refer to the Installation and Operating Instructions for proper gas supply, safety requirements and operating instructions.

HIGH CAPACITY POWER VENT KIT

- Horizontal Termination Applications Only

TCVT.PVAX21
INSTALLATION
AND
OPERATING
INSTRUCTIONS

For use with the TC54 “C” & “D” Series Town & Country Fireplaces Only

NOTE:

THIS POWER VENT KIT USES ONLY T&C 8X11 FLUE PIPE

High Capacity Power Vent Installation

This Power Vent can only be used with the TC54 Town and Country fireplace. Locate the fireplace as per the main instructions supplied.

Make the following modifications to add the components used with the Power Vent Kits.

This installation must conform with local codes or, in the absence of local codes, with the Natural Fuel Gas Code, ANSI Z223.1/NFPA 54, or the Natural Gas and Propane Installation Code, CSA B149.1.

Contents of High Capacity Power Vent

UNDER NO CIRCUMSTANCES SHALL A RHEOSTAT BE USED TO ALTER THE VOLTAGE SUPPLY TO THIS UNIT.

Any of the silicon seals on the outer box that are broken during servicing must be re-sealed using RTV silicon during re-assembly to ensure a weather-proof seal.

Contents of High Capacity Power Vent

Minimum clearances to combustible

Vertical vent pipe:
1.75 in. (45mm)

Horizontal vent pipe:
Top   1.75 in. (45mm)
Sides 1.75 in. (45mm)
Bottom 1.75 in. (45mm)

All other clearances are as per the fireplace installation instructions.

High Capacity Power Vent

Maximum vent length is 66 ft plus six 90 degree elbows or combination of other elbows equaling 90 degrees.

Minimum venting - 10’ plus one 90 degree elbow.

The vent can be installed with any combination of rise and run between the above figures including 3 ft below the unit. Ensure that the vent pipe is properly supported.

Figure 1: Venting configurations.

</tbody>
</table>

* a vent shall not terminate directly above a side-walk or paved driveway which is located between two single family dwellings and serves both dwellings*

** only permitted if veranda, porch, deck, or balcony is fully open on a minimum of 2 sides beneath the floor*

* as specified in CGA B149 Installation Codes, Note: local Codes or Regulation may require different clearances

* for U.S.A. Installations follow the current National Fuel Gas Code, ANSI Z223.1
Horizontal (Side Wall) Venting

This kit uses Town and Country direct vent pipe with a 8” inner pipe and an 11” outer pipe. For part numbers see the table of venting components on page 12 & 13 of this manual.

1. Locate the power vent termination following the clearance to combustible table, venting configuration diagram (Figure 1) and terminal location diagram (Figure 3).

2. Cut and frame a 14” x 14” opening. The centre of the square hole should line up with the centre line of the horizontal pipe.

3. Install the Town and Country firestop in the opening to retain any insulation in the wall and maintain proper clearances. If the wall being penetrated is constructed of non-combustible material only (i.e. Masonry block or concrete) the wall thimble is not required and a hole with zero clearance is acceptable. (11” hole)

4. Attach the terminal to the outside wall. Ensure that the terminal is the right way up and that only the outer flanges that are used to secure the terminal to the building are covered by the exterior wall or siding (Figure 4). Note: No other part of the terminal can be recessed into the exterior wall or siding.

5. Attach the vent adapter directly to the appliance with three screws and seal outer pipe with aluminium tape provided. Note: The inner pipe does not need to be sealed.

6. Connect the high temperature silicone tube to the vacuum pressure tap on the adaptor, secure with the hose clamp provided and route the tube through any hole back to control box (Figure 5). Tube may touch unit and be trimmed if required.  
   **Note:** Ensure that there are no blockages in this tube, as this will cause the control to malfunction.

7. Run the required pipe from the adaptor to the terminal assembly.
The gas control system is located on the right hand side of the firebox behind an access panel and the decorative brick panel.

1. Remove burner grate, logs and brick panels if already installed.

2. Remove access panel from right hand side of the firebox (Figure 6).

3. Locate and disconnect the spade connectors in the black wire loop on the right side of the module (Figure 7).

Figure 6: Access panel.

Figure 7: Spade connector location.
4. Connect the two modules in series by connecting a male connector from black wire loop from the one module to the female connector from the black wire loop on the other module (Figure 8).

5. Connect the remaining male and female connectors from the black loops on each module to the pig tail connections supplied (Figure 9).
C Series instructions

6. Connect the 120V hot supply wire to one of the pig tails from the module (Figure 10).

7. Connect the white (neutral) wire from the 120V power supply to the remaining wire from the blowers (Figure 10).

8. Connect one of the black wires from the blowers to the other pig tail from the module (Figure 11).

Figure 10: Wiring from power supply.

Figure 11: Wiring from blowers.
9. Locate Mounting position for Pressure Switch (Figure 12) & (Figure 13).

Figure 12: Opened access panel.

Figure 13: Pressure switch mounting location.
10. Connect the Orange wires from the pressure switch to the orange wires on both modules. Valve 1 to left Module and Valve 2 to the right Module (Figure 14).

11. Secure the pressure switch in the control box using the bracket provided with this kit (Figure 15).
12. Attach the silicone tube from the pressure tap to the Tee connected to the low side of the pressure switches and secure using the hose clamps provided (Figure 17).

13. Position all wiring to ensure that there is no contact with the firebox side.

14. Continue with installation and reassemble all of the parts previously removed.

NOTE: IF THERE IS NO MOUNTING HOLE IN CONTROL BOX, DRILL A HOLE USING 1/8" DRILL BIT

Figure 16: Mounting location.

THIS POWER VENT SYSTEM CAN ONLY RUN ON 115 V AC. BEFORE OPERATING THE UNIT, THE BATTERY BACKUP LOCATED BEHIND THE WALL SWITCH RECEIVER MUST BE REMOVED.

Figure 17: Securing tubes.
Pressure Switches must be mounted vertically

The gas control system is located on the right hand side of the firebox behind an access panel and the decorative firebox panel (if installed). The fireplace is operated via a wall control and a hand held remote control unit.

The wall control is connected to the fireplace by a 40 ft. communication cable supplied with the fireplace.

**Installation**

1. Place the fireplace in the desired location.
2. Remove the window from the fireplace.
3. Remove access panel from right hand side of the firebox (Figure 20).
4. Connect 110 V. AC electrical supply to the wires installed inside the junction box (Figure 21). The fireplace is rated at 110 volts, 60Hz, 0.25A. The optional power vent kit is rated at 115 volts, 60Hz, 1.8A.
   
   The electrical wires can be accessed from both inside and outside the junction box by removing one of the two small access panels (Figure 21) & (Figure 22).

5. Connect the gas supply to the valve (Figure 22).
6. Attach one end of the wall switch control cable to the wall control. (not shown), and the other end to the interface board (Figure 22).
7. If not already installed, install the burner using the instructions supplied with the burner kit.
8. Turn on the gas supply and check that all connections are tight and leak free.
Selecting Natural Vent & Power Vent Modes

The NV / PV (Natural Vent / Power Vent) switch (Figure 24) on the interface board (Figure 22) is set according to which type of evacuating vent system is present. If the fireplace is vented without the assistance of a power vent, the switch should be set to “NV”. If using a power vent, “PV” should be selected.

Important Note:

When switching between NV and PV, both the electrical power supply to the fireplace must be turned off and the backup batteries removed to properly re-set the module.
