This appliance may be installed in an aftermarket permanently located, manufactured home (USA only) or mobile home, where not prohibited by local codes. This appliance is only for use with the type of gas indicated on the rating plate. This appliance is not convertible for use with other gases, unless a certified kit is used.

FOR YOUR SAFETY
Installation and service must be performed by a qualified installer, service agency or the gas supplier.

WHAT TO DO IF YOU SMELL GAS
• Do not try to light any appliance.
• Do not touch any electrical switch.
• Do not use any phone in your building.
• Immediately call your gas supplier from a neighbour’s phone. Follow the gas supplier’s instructions.
• If you cannot reach your gas supplier call the fire department.

Do not store or use gasoline or other flammable vapors and liquids in the vicinity of this or any other appliance.

WARNING: If the information in these instructions is not followed exactly, a fire or explosion may result causing property damage, personal injury or death.

INSTALLER: Leave this manual with the appliance.
CONSUMER: Retain this manual for future reference.

Caution

This appliance and its individual shut off valve must be disconnected from gas supply piping system during any pressure testing of that system at test pressures in excess of 1/2 psig (3.5 kPa).

This appliance must be isolated from the gas supply piping system by closing its individual manual shut off valve during any pressure testing of the gas supply piping system at test pressures equal to or less than 1/2 psig (3.5 kPa).

Do not use the fire feature if any part has been under water. Immediately call a qualified service technician to inspect the fire feature and to replace any part of the control system and any gas control which has been under water.

WARNING: This product can expose you to chemicals including ceramic fibers, which are known to the State of California to cause cancer, and carbon monoxide, which is known to the State of California to cause birth defects or other reproductive harm. For more information go to www.P65Warnings.ca.gov.

This warning is applicable to all Pacific Energy Fireplace Products

Safety

Any grill, panel or door removed for servicing the unit must be replaced prior to operating. Failure to do so may create a hazardous condition.

Installation and repair should be done by a qualified service person. The appliance should be inspected before use and at least annually by a professional service person. More frequent cleaning may be required due to excessive lint from carpeting, bedding material, etc. It is imperative that control compartments, burners and circulating air passageways of the appliance be kept clean.

It is our policy that no responsibility is assumed by the Company or by any of its employees or representatives for any damages caused by an inoperable, inadequate, or unsafe condition which is the result, either directly or indirectly, of any improper operation or installation procedures.

This appliance must not be connected to a chimney flue serving a separate solid fuel burning appliance.
(a) For all side wall horizontally vented gas fueled equipment installed in every dwelling, building or structure used in whole or in part for residential purposes, including those owned or operated by the Commonwealth and where the side wall exhaust vent termination is less than seven (7) feet above finished grade in the area of the venting, including but not limited to decks and porches, the following requirements shall be satisfied.

1. INSTALLATION OF CARBON MONOXIDE DETECTORS. At the time of installation of the side wall horizontal vented gas fueled equipment, the installing plumber or gas fitter shall observe that a hard wired carbon monoxide detector with an alarm and battery back-up is installed on the floor level where the gas equipment is to be installed, in addition, the installing plumber or gas fitter shall observe that a battery operated or hard-wired carbon monoxide detector with an alarm is installed on each additional level of the dwelling, building or structure served by the side wall horizontal vented gas fueled equipment. It shall be the responsibility of the property owner to secure the services of qualified licensed professionals for the installation of hard-wired carbon monoxide detectors.

a. In the event that the side wall horizontally vented gas fueled equipment is installed in a crawl space or an attic, the hard-wired carbon monoxide detector with alarm and battery back-up may be installed on the next adjacent floor level.

b. In the event that the requirements of this subdivision cannot be met at the time of completion of installation, the owner shall have a period of thirty (30) days to comply with the above requirements; provided, however, that during said thirty (30) day period, a battery operated carbon monoxide detector with an alarm shall be installed.

2. APPROVED CARBON MONOXIDE DETECTORS. Each carbon monoxide detector as required in accordance with the above provisions shall comply with NFPA 720 and be ANSI/UL 2034 listed as IAS certified.

3. SIGNAGE. A metal or plastic identification plate shall be permanently mounted to the exterior of the building at a minimum height of eight (8) feet above grade directly in line with the exhaust vent terminal for the horizontally vented gas fueled heating appliance or equipment. The sign shall read, in print size no less than one-half (1/2) inch in size, “GAS VENT DIRECTLY BELOW. KEEP CLEAR OF ALL OBSTRUCTIONS.”

4. INSPECTION. The state or local gas inspector of the side wall horizontally vented gas fueled equipment shall not approve the installation unless, upon inspection, the inspector observes carbon monoxide detectors and signage installed in accordance with the provisions of 248 CMR 5.089(2) (a) 1 through 4.

(b) EXEMPTIONS. The following equipment is exempt from 248 CMR 5.089(2)(a) 1 through 4.

1. The equipment listed in Chapter 10 entitled “Equipment Not Required To Be Vented” in the most current edition of NFPA 54 as adopted by the Board; and

2. Product Approved side wall horizontal vented gas fueled equipment installed in a room or structure separate from the dwelling, building or structure used in whole or in part for residential purposes.

(c) MANUFACTURER REQUIREMENTS – GAS EQUIPMENT VENTING SYSTEM PROVIDED. When the manufacturer of Product Approved side wall horizontally vented gas equipment provides a venting system design or venting system components with the equipment, the instructions provided by the manufacturer for installation of the equipment and the venting system shall include:

1. Detailed instructions for the installation of the venting system design or the venting system components; and

2. A complete parts list for the venting system design or venting system.

(d) MANUFACTURER REQUIREMENTS – GAS EQUIPMENT VENTING SYSTEM NOT PROVIDED. When the manufacturer of a Product Approved side wall horizontally vented gas fueled equipment does not provide the parts for venting the fuel gases, but identifies “special venting systems,” the following requirements shall be satisfied by the manufacturer.

1. The referenced “special venting system” instructions shall be included with the appliance or equipment installation instructions; and

2. The “special venting systems” shall be Product Approved by the Board, and the instructions for that system shall include a parts list and detailed installation instructions.

(e) A copy of all installation instructions for all Product Approved side wall horizontally vented gas fueled equipment, all venting instructions, all parts lists for venting instructions, and/or all venting design instructions shall remain with the appliance or equipment at the completion of the installation.
Congratulations on your Town & Country purchase

Your Architectural Series Zero Clearance linear appliance has been professionally installed by:

Dealer name: _____________________________________________

Phone Number: ___________________________________________

If you discover any problems with your linear appliance, contact your dealer immediately to have the unit repaired.

Caution: Do not attempt to repair the linear appliance because you may cause injury to yourself or others, and risk causing damage to the unit.

Before operating your linear appliance carefully read this manual and pay close attention to all Safety Warnings. The manual contains important information on the unit’s safe operation and maintenance.

Installation Requirements/Appliance Specifications

Specifications

- This unit has been tested to ANSI Z21.50 and CSA P.4.1 specifications.
- Single wall (min. 26 ga) galvanized venting. (Zero clearance)
- 120VAC / single phase.
- 24VAC Honeywell direct ignition valve system.
- Power vented only. Programmed with pre and post-purge safety functioning. Certified to use provided Town & Country power vent only.
- Horizontal or Vertical Termination.
- Zero clearance unit (no non-combustible board required).
- 12" rigid exhaust - 150ft max length plus up to 6 elbows. (Zero clearance)
- 7" rigid intakes - (All bottom intake models) 150ft max length plus up to 6 elbows. (Zero clearance)
- 10" rigid intakes - (All top intake models) 150ft max length plus up to 6 elbows. (Zero clearance)

Installation Requirements

The fireplace installation and venting must conform to the current CAN/CGA-B149 installation code (in Canada) or the current National Fuel Gas Code, ANSI Z223.1 (in the USA), and approved per local codes. Only qualified (licensed or trained) personnel should install this product.

In the state of Massachusetts, only a licensed Plumber and Gas Fitter may install this product.
Minimum Clearances to Combustible Material

This appliance is a zero clearance fire feature. Combustible material may be use to frame the unit in.

Venting for this unit is also zero clearance. Combustible material is permitted to come into direct contact with venting material.

Figure 4: Corner Left 32 inch tall glass.
Minimum Clearances to Combustible Material

- This appliance is a zero clearance fire feature.
- Combustible material may be used to frame this unit in.
- Venting for this unit is also zero clearance.
- Combustible material is permitted to come into direct contact with venting material.
- Optional site fabricated elevated platform
Because the Architectural Series Linear Appliance is power vented, it can be located in a variety of places. Consideration must be taken for the location of the fresh air intake and the power vent unit venting. An optional site fabricated platform capable of supporting the appliances weight may be constructed to elevate the viewing area to the desired height, and so that it can accommodate the fresh air intakes (if bottom vented), gas supply and electrical supply.

Figure 5: Location options for Bottom Intake models.
Figure 6: Location options for Top Intake models.
Before framing and finishing, there are two important points to keep in mind:

1. When securing the top of the unit to the wooden studs, the screws must come through the metal framing from the center of the unit (Figure 7).

2. Facing material can be secured directly to the front and sides of the unit except in the areas indicated in this example by Figure 8. Each model will have its own specific areas in which screws must not be driven into.

Facing material may be screwed directly into the body of the appliance with the exception of areas indicated.

Figure 7: Stud securing points for bottom intake models.

Figure 8: Facing attachment area for Bottom Intake models.
Before framing and finishing, there are two important points to keep in mind:

1. When securing wooden studs to the top of the unit, the screws can be secured through any part of the upper fastening area surface (Figure 9).

2. Facing material can be secured directly to the front and sides of the unit except in the areas indicated in this example by Figure 10. Each model will have its own specific areas in which screws must not be driven into.

Facing material may be screwed directly into the body of the appliance with the exception of areas indicated.

Figure 9: Stud securing points for Top Intake models.

Figure 10: Facing attachment area for Top Intake models.
NOTE: The architectural series fireplaces have a large amount of venting air being drawn through them. It is recommended to insulate the framework that encloses the venting above the fireplace with a sound-proofing insulation such as mineral wool, to reduce any air flow white noise.
Facing Material

Because the unit requires no clearance to combustible material, drywall or other facing material can be affixed directly to the surface of the unit. Using standard 2x4’s and 2x6’s in the framing process allows for the edge of 1/2” drywall or other facing material to fit into the channels which make up the perimeter of the exterior glass sheets (Figure 12 and Figure 13).

**NOTE:** The architectural series fireplaces with the exception of the peninsula models are capable of bearing up to 1000lbs of facing material weight. Up to 1 inch stone may be used. An architectural series fireplace is not to be used as a load bearing structure.

Figure 12: Leading edge of drywall.

Figure 13: Right side framing and facing view.
Venting Configuration

**NOTE:** Plenum must not be shared with other appliances.

Some installations - particularly in new renovations or with pre-existing constraints / obstacles may require the construction of a plenum in order to accommodate multiple air intakes.

The plenum must be made of furnace ducting (Minimum 26 gauge) or other material impervious to moisture. The constructed plenum must have a minimum cross-section of 150in² and be sealed to the air-intake collars on the appliance. The plenum may be transitioned to a single intake as long as the recommended cross-section is maintained.

For a single air intake, the rule of a maximum of 150 feet plus 6 elbows still applies.

Figure 14: Venting configurations for bottom intake models.

**Venting plenum**
Top Intake Models

Surface mount power vent

Flat roof configuration

Riser required
(Min. 12” high. Check local codes).

Surface mount power vent

Peaked roof configuration

Riser required
(Min. 12” high. Check local codes).

Riser required
(Min. 12” high. Check local codes).

Direction of air flow

Maximum flue outlet pipe length is 150 feet plus 6 elbows.
Maximum combustion air inlet pipe is 150 feet plus 6 elbows.

Figure 15: Venting configurations for Top Intake models.
Venting Specifications

**Bottom Intake Models**

- Intakes combined into a larger single duct to reduce exterior penetrations.
- All venting including exhaust is zero clearance to combustible materials.
- 12” exhaust venting can be a maximum of 150ft plus 6 elbows.
- For servicing purposes, it is recommended that, if possible, the optional motorized dampers be accessible after installation.
- Must use 7” intake venting lines. Each venting line can be a maximum of 150ft plus 6 elbows.
- Fresh air intakes can be joined into a larger single duct or plenum. (Minimum 150 in² cross-section for all models)

Figure 16: Venting specifications for Bottom Intake models.

- Bottom Air intake venting uses three 7” standard single wall furnace grade venting ducts on 3-6ft burner models, and four 7” vents on 7-8ft models. All vent intakes must be used. Each intake line can be up to a maximum of 150 ft plus 6 elbows.
- Motorized dampers are optional.
- Exhaust venting uses 12” standard single wall furnace grade venting material. Maximum length is 150 ft plus 6 elbows.
- All Venting is zero clearance.
- All Vent seams (Intake and Exhaust) including elbow rivets must be sealed with high temperature aluminum tape.
Air intake vents
Optional motorized dampers
Must use 10 inch intake venting lines. Each venting line can be a maximum of 150ft plus 6 elbows.

12" exhaust venting can be a maximum of 150ft plus 6 elbows.
For servicing purposes, it is recommended that, if possible, the optional motorized dampers be accessible after installation.

Must use 10 inch intake venting lines. Each venting line can be a maximum of 150ft plus 6 elbows.

Fresh air intakes can be joined into a larger single duct or plenum. (Minimum 150 in² cross-section for all models)

All venting including exhaust is zero clearance to combustible materials.

Power vent mounted vertically with intake vents built into an elevated riser.

Power vent mounted horizontally.

Intakes combined into a larger single duct to reduce exterior penetrations.

Figure 17: Venting specifications for Top Intake models.

- Top Air intake venting uses two 10" standard single wall furnace grade venting ducts on all models. Both lines must be used. Each intake line can be up to a maximum of 150 ft plus 6 elbows.

- Motorized dampers are optional.

- Exhaust venting uses 12" standard single wall furnace grade venting material. Maximum length is 150 ft plus 6 elbows.
- All Venting is zero clearance.

- All Vent seams (Intake and Exhaust) including elbow rivets must be sealed with high temperature aluminum tape.

TOP

REAR

SIDE

Dimensions

10 3/4" 8 7/8"
6 3/4"
3 1/2"
1 7/8"
10 Inch Intake Hood Dimensions
The optional motorized damper closes off air from the outside being able to enter the fireplace when the fireplace is off. This unit is mounted near the air intake vent. This unit is wired directly to the fireplace body (Figure 65 on page 41). One motorized damper is required for each of the air intake venting lines.

All bottom intake models use 7 inch motorized dampers if required for installation.

All top intake models use 10 inch motorized dampers if required for installation.
We recommend attaching this collar as close to the power vent as possible to reduce vibration from the power vent through the vent pipe.

Use the provided lag screws to attach the power vent to the site constructed riser or curb. There are 8 holes around the base. (Two per side).
Power Vent Dimensions

Vertical Installation

Figure 25: Power vent vertical installation.
When installing the power vent horizontally, ensure the side of the power vent with the attached electrical junction box is facing downwards.

Use exterior silicone/caulk around the base of the power vent to seal it to the building envelope.

Any horizontal run leading to the power vent shall be sloped down to the outside at a minimum of 1/4 inch per foot of vent length.
Note: Minimum 3 feet clearance from solid objects/walls or between multiple power vents.

Figure 27: Power vent clearances.

Attach the anti-vibration collar as close to the power vent as possible.
When installing the power vent horizontally, ensure the side of the power vent with the attached electrical junction box is facing downwards.
Flush Mount Power Vent Details

115 VAC Single phase
60/50 Hz
1/2 HP
6.8 Amps
Weight: Approx. 30 lbs.

Flush Mount Power Vent Dimensions

Figure 33: Architectural series power vent dimensions.
The Architectural Series Power Vent must be mounted into a constructed frame. The size of the unit (28” x 28”) means that part of a stud will need to be removed in order to build the frame.

Before installing the fan into the frame, the front grill must be removed so an electrical connection can be established.

**Removing the grill**

The front grill must be removed before installing the unit into its frame. Locate and remove the four screws affixing the grill to the unit (Figure 34) - remove grill and set aside.

![Figure 34: Screws for grill.](image)

![Figure 35: Securing points for the fan unit.](image)

**Installing the fan unit**

The fan unit weighs approximately 30 lbs and so the constructed frame must be able to support its weight.

The fan unit is secured to the constructed frame using the 12 supplied screws.

**Note:** The constructed frame must be built in accordance with local building codes.

---

**Minimum Clearances to Combustibles**

- Body of Power Vent: 0”
- Vent pipe: 0”
Framing the Flush Mount Power Vent

Recommended framing. See local building codes for more information.

Figure 36: Fan - without grill, installed.
Flush Mount Electrical Connection

Note: Ensure that the power is disconnected at its source before proceeding.

The fan unit operates using 120VAC supplied from the fireplace. Once the fan unit is secured to its frame, the power line can be brought in from the rear of the unit. Be sure that the plastic grommet is installed in the hole where the power line is coming through (Figure 37).

Strip the three wires and secure to the control module as shown in Figure 38.

Once the power line has been secured, tighten the strain relief at the rear of the unit so that there is no undue stress on the power line (Figure 39).

Note: The control module has a speed variation adjustment which has had the knob removed (Figure 40). The fan speed has been set during the manufacturing process and must not be adjusted in the field.
The air baffle (Figure 41) is set to fully open before it is shipped and might need adjustment. However, if adjustment is required, the sliding plates can be moved by inserting a screwdriver or other object up through the baffle cover (Figure 42). There is a bracket on either end of the baffle to use for easy adjustment. If the flame pattern is too hectic, close the baffle opening a half inch at a time and monitor the flame with all glass panes installed.

**NOTE:** The more you close the baffle, the more the outer glass temperature will rise, as less heat is being evacuated from the combustion zone.

The baffle cover is secured with six bolts (Figure 42). If removal of the baffle cover is necessary, always remove the two center bolts last, as well as installing them first when re-installing the baffle cover.
All units ship with a capped half inch NPT pipe for gas connection (Figure 43).

All units also ship with a gas valve shut-off (Figure 44). This shut-off handle is located on the right side of the glass door opening between the inner and outer glass panes. Push this handle down before installing the outer glass panes.
Black Glass Option Installation

Note: Installation of the rear black glass plate is a two person job.

1. Using the supplied suction cups, insert the top edge of the rear black glass plate into its slot located on the ceiling of the unit (Figure 45).

2. With the top edge of the plate lifted into its slot, maneuver the bottom edge of the plate over top of the mesh tray and lower the plate down into its slot (Figure 46).

Figure 45: Insert top end of rear black glass plate first.

Figure 46: Lift bottom end of black glass over the rear mesh screen.
3. Insert the top edge of the left hand black glass sheet into its slot located in the ceiling of the unit (Figure 48).

4. With the top edge of the side plate lifted into its slot, maneuver the bottom edge of the plate over top of the pilot assembly and over the mesh tray and lower the plate down into its slot (Figure 49).

5. Once all black glass plate are installed, fill the burner tray with crushed glass media.
Front and Side Glass Plates Installation

Inside glass plates installation
Because of working space constraints, the upper edge of the inner glass plates cannot be immediately inserted into the upper inner slots (Figure 50) until the bottom edge of the glass plate has been lowered into the large gap between the furthest louver and the lower inner slots (Figure 51). Once the glass plate has been lowered into this gap the upper edge can then be lifted up into the upper inner slot.

1. There are 3 horizontal louvers at the bottom of the fireplace opening extending the length of the opening. The bottom edge of the inner glass plates will be inserted down into the gap behind the furthest louver (Figure 51).
2. Install the right side glass plate first. Insert the lower edge of the right side glass plate into the gap directly behind the furthest louver. Then raise the upper edge of the glass plate into its upper inside slot. Tilt the right side glass plate to a vertical position and lower the glass plate into the lower inside slot.

Figure 50: Upper slots for front glass plates.

Figure 51: Insertion point between furthest louver and lower inside slot.

Figure 52: Right hand glass plate pushed toward rear wall.

Figure 53: Lowering bottom edge of inner front plate into gap.
3. Before removing the suction handle, shift the right side glass plate toward the rear wall so that this glass plate will not interfere with the inside front glass plate while it is being installed (Figure 52).

4. Repeat this procedure to install the inside front glass plate. Using the suction handles, insert the lower edge of the inside front glass plate into the gap directly behind the furthest louver (Figure 53).

5. Once the lower edge has been inserted into the gap, tilt the glass plate forward and raise the upper edge into the upper inner slot (Figure 54).

6. Lower the inside front glass plate down into its lower slot (Figure 55). Center this glass plate.

7. Using a suction handle, gently shift the inside right hand glass plate forward in its slot until it just touches the inside front glass plate (Figure 56).
Inside securing plates installation

There are two identical securing plates which will mount between the inner and outer front and side glass plates (Figure 57)

1. Install the inside securing plates into the slots at each end of the fireplace opening and lift up until they make contact with the magnets which will hold them in place (Figure 58). Keep the flared edges of the securing plates up against the inside front and side glass plates and gently push them until the securing plates make contact with the inner glass plates. This will ensure that the inner glass plates do not vibrate because of the airflow inside the fireplace (Figure 59).

Figure 57: Inside securing plates.

Figure 58: Left side securing plate installation.

Make sure that the securing plate is pushed right up to the inside glass plate. This will keep any vibration to a minimum.

Figure 59: Position securing plate up against the inside glass plate.
Outside glass plates installation

Two plates of glass make up the outside set, one small side pane which is installed first followed by the large outside plate. To install:

1. Using a glass suction handle, lift the top edge of the small glass side plate into the narrow channel at the top edge of the trim (Figure 60).

2. Lower the plate to a vertical position, and lower the plate into the bottom channel (Figure 61). Once the plate is in the lower channel, shift it toward the rear wall - as was done with the inside side plate (See Figure 52 on page 37) so as to create enough room so that when the large outside front plate is installed it does not come into contact with the smaller side plate.

3. Install the large outside front glass plate (Figure 62) as was done with the inside plate

4. The outside side plate can now be brought closer to the front pane so that their edges just touch.
Power to this unit is 120VAC. The electrical connection boxes are located behind a removable panel that runs the length of the lower side of the appliance. After the panel is removed, the electrical connection box cover can be removed to access the wiring (Figure 63). Once wiring is completed (Figure 66), power will be supplied to both the power vent and the main unit control module. The optional motorized dampers wiring is located behind the removable panel as well in the second connection box (Figure 63). There will be a pair of wires for the appropriate number of dampers specified for the appliance (Figure 65). These wires are not polar specific. Low voltage wiring can be used for connecting the dampers. The CAT5e cable is located here as well. Connect the Cat5e cable to the control panel wall receptacle (Figure 72 on page 44). Ensure the wiring strain relief clamps are snug and secure.

Re-attach the box covers, followed by the compartment panel when all wiring is complete. Use aluminum tape to seal all seams of the compartment panel before attaching facing material.
Figure 66: Wiring diagram.
**Control Panel Installation**

**Installation instructions**

**NOTE:** The CAT5e cable has a maximum length of 50 feet and so the touch pad must be installed within this distance.

**NOTE:** Make sure that the touch pad is fully charged and its ON/OFF switch is in the ON position before mounting the touch pad in its frame.

**NOTE:** Make sure that the AC power to this appliance is turned off before installing the touch pad.

Place touch pad frame template at desired point against drywall. Use a level to finalize the template position.

1. Mark the inside of the template with a pencil (Figure 68).

2. Cut out the touch pad frame opening along the pencil mark (Figure 69).

Figure 67: Leveling the template.

Figure 68: Drawing the cut out.

Figure 69: Cutting out the panel opening.

Figure 70: Opening ready for panel frame.
3. Bring one end of the CAT5e cable out through the opening from behind the drywall (Figure 71).

4. Plug the CAT5e cable into the touch pad frame as shown in Figure 72.

5. Orient the touch pad frame as shown in Figure 73 and place the frame into the opening and firmly seat.

**NOTE:** The BlueTooth PIN code is located on its board. Take note of the code before mounting the touch pad in its frame.

Figure 72: Inserting CAT5e cable into touch pad frame.

Figure 73: Proper orientation of touch pad frame.
1. There are 2 locking tabs - one on the lower left hand corner and one on the upper right hand corner of the touch pad frame. Using a screw driver, rotate the locking tab from the unlocked position (Figure 74) to the locked position and tighten the screw (Figure 75). The tabs will now be behind the drywall securing the touch pad frame in place.

2. Plug the black connector into the touch pad (Figure 76). The connector should be on the left hand side of the frame as it is inserted into the frame. **NOTE: Turn the touch pad ON before installing it into the frame.**
3. Place the touch pad into the frame. There are 4 touch pad holding tabs which will hold the touch pad in place (Figure 77).

Figure 77: Touch pad holding tabs.

Figure 78: Touch pad in frame.
4. Finish by placing the face plate over the touch pad (Figure 79).

NOTE: The touch pad frame has a room temperature sensor (Figure 78 on page 46) which will shut the system down if the room temperature exceeds 40°C / 104°F.

There is also a system disable switch which turns off the appliance until such time that it is turned back on. Both the room over-temperature sensor and the system disable switch are accessible with the face plate in place.
There are two rows of LED lights in this fire feature, one row on each side of the burner. Each row of LED lights is made of individual LED sections (Figure 80) which can be joined together using bridge connectors to achieve the desired row length (Figure 81). Each row of sections also has its own main electrical connector (Figure 82).

### Removing an LED section

1. To remove an individual LED section or sections, begin by disconnecting the main power to the fire feature at the main circuit breaker. Give time for the unit to cool down.

2. Remove the inner and outer glass plates.

3. Remove the glass media and the burner tray.

4. Remove the bridge connector of the LED section(s) to be replaced (Figure 83). These connector tabs lift up much like the main electrical connector (Figure 82). In this way, individual LED sections can be replaced without removing the entire row of LED sections from the fire feature.

5. The LED sections and rows are held in place by hold down tabs (Figure 84). These tabs can be lifted up so that the LED section can be removed.
6. When removing an individual LED section, lift up the side of the LED section next to the tabs that were just moved upwards and then remove the LED section (Figure 85).

NOTE: When replacing an LED section, make sure that the arrows on the sections meet as shown in Figure 86. Whether joining full sized sections to other full sized sections, or when joining a full sized section to a short section, the arrows must meet each other. As you stand in front of the fire feature, the arrows will be located on the sides of the sections furthest away from you.

7. Reconnect the individual LED sections using a bridge connector as shown in (Figure 83).

8. Reconnect the main electrical connector as shown in Figure 82.

9. Return the glass tray(s), glass media and glass panels to their original positions.

FOR YOUR SAFETY READ BEFORE LIGHTING

Warning: If you do not follow these instructions exactly, a fire or explosion may result causing property damage, personal injury or loss of life.

A. BEFORE LIGHTING: smell all around the appliance area for gas. Be sure to smell next to the floor because some gas is heavier than air and will settle on the floor.

WHAT TO DO IF YOU SMELL GAS:
- Do not try to light any appliance.
- Do not touch any electrical switch; do not use any phone in your building.
- Immediately call your gas supplier from a neighbour’s phone. Follow the supplier’s instructions.
- If you cannot reach your gas supplier, call the fire department.

B. Do not use this appliance if any part has been under water. Immediately call a qualified service technician to inspect the appliance & to replace any part of the control system & any gas control which has been under water.

LIGHTING INSTRUCTIONS

1. STOP! Read the safety information above this label.
2. Move switch to “ON” position (unit will purge for 10 seconds)
3. The appliance will try igniting 3 times. If the appliance fails to ignite, the control will lock out.
4. Call your service technician or retailer to rectify the issue.

TO TURN OFF GAS APPLIANCE

1. Move switch to the “OFF” position (unit will post-purge for 15 seconds).
2. Turn off all electrical power to the appliance if service is to be performed or for extended shutdown.

CAUTION: Hot while in operation. Do not touch. Severe burns may result. Keep children, clothing, furniture, gasoline and other liquids having flammable vapours away. Keep burner and control compartments clean. See installation and operating instructions accompanying the appliance.

CAUTION:

Turn off gas and electrical power supply (if applicable) and allow ample time for unit to cool before servicing appliance. It is recommended that the fire feature and its venting be inspected at least once a year by a qualified service person.

GLASS PANEL:

Warning: Do not operate fire feature with glass panel removed, cracked or broken. Replacement of the glass panel should be done by a licensed or qualified service person.

Do not strike or otherwise impact the glass in anyway that may cause it to break. If the glass becomes cracked or broken it must be replaced before using the fire feature. Replacement glass can be obtained from your nearest Town & Country Fireplaces dealer.

ANNUAL INSPECTION:

a) Remove glass panel and inspect the Burner and Igniter for soot build up. If excessive build up of soot is present, have a qualified service person inspect and adjust the unit for proper combustion.

b) Check that the venting pipe and venting terminal are open and free from blockage or debris. If the venting is disassembled for cleaning, it must be properly assembled and re-sealed. Refer to VENTING section for proper procedure.

Note: The appliance area must be kept clear and free from combustible materials, gasoline and other flammable vapours and liquids.

Periodically:

a) Viewing glass may be cleaned as necessary with fireplace glass cleaner.

CAUTION:

Do not use abrasive cleaners on glass or any other part of the fire feature.

Do not clean glass when hot.
