INSTALLATION MANUAL

FOR YOUR SAFETY
Installation and service must be performed by a qualified installer, service agency or the gas supplier.

WHAT TO DO IF YOU SMELL GAS
• Do not try to light any appliance.
• Do not touch any electrical switch.
• Do not use any phone in your building.
• Immediately call your gas supplier from a neighbour’s phone. Follow the gas supplier’s instructions.
• If you cannot reach your gas supplier call the fire department.

Do not store or use gasoline or other flammable vapors and liquids in the vicinity of this or any other appliance.

This appliance is suitable for installation in a bedroom or bed sitting room.

This appliance may be installed in an aftermarket permanently located, manufactured home (USA only) or mobile home, where not prohibited by local codes. This appliance is only for use with the type of gas indicated on the rating plate. This appliance is not convertible for use with other gases, unless a certified kit is used.

WARNING: If the information in these instructions is not followed exactly, a fire or explosion may result causing property damage, personal injury or death.

INSTALLER: Leave this manual with the appliance.
CONSUMER: Retain this manual for future reference.

Caution

This appliance and its individual shut off valve must be disconnected from gas supply piping system during any pressure testing of that system at test pressures in excess of 1/2 psig (3.5 kPa).

This appliance must be isolated from the gas supply piping system by closing its individual manual shut off valve during any pressure testing of the gas supply piping system at test pressures equal to or less than 1/2 psig (3.5 kPa).

Do not use the fire feature if any part has been under water. Immediately call a qualified service technician to inspect the fire feature and to replace any part of the control system and any gas control which has been under water.

Power supply to the fireplace must be shut off before connecting or disconnecting the CAT5e cable to the touch screen/toggle switch wall receptacle. This also applies to the touch screen charging cable.

WARNING: This product can expose you to chemicals including ceramic fibers, which are known to the State of California to cause cancer, and carbon monoxide, which is known to the State of California to cause birth defects or other reproductive harm. For more information go to www.P65Warnings.ca.gov.

This warning is applicable to all Pacific Energy Fireplace Products

Safety

Any grill, panel or door removed for servicing the unit must be replaced prior to operating. Failure to do so may create a hazardous condition.

Installation and repair should be done by a qualified service person. The appliance should be inspected before use and at least annually by a professional service person. More frequent cleaning may be required due to excessive lint from carpeting, bedding material, etc. It is imperative that control compartments, burners and circulating air passageways of the appliance be kept clean.

It is our policy that no responsibility is assumed by the Company or by any of its employees or representatives for any damages caused by an inoperable, inadequate, or unsafe condition which is the result, either directly or indirectly, of any improper operation or installation procedures.

This appliance must not be connected to a chimney flue serving a separate solid fuel burning appliance.
Important Note for the Commonwealth of Massachusetts

From Massachusetts Rules and Regulations 248 CMR 5.08:

(a) For all side wall horizontally vented gas fueled equipment installed in every dwelling, building or structure used in whole or in part for residential purposes, including those owned or operated by the Commonwealth and where the side wall exhaust vent termination is less than seven (7) feet above finished grade in the area of the venting, including but not limited to decks and porches, the following requirements shall be satisfied.

1. INSTALLATION OF CARBON MONOXIDE DETECTORS. At the time of installation of the side wall horizontal vented gas fueled equipment, the installing plumber or gas fitter shall observe that a hard wired carbon monoxide detector with an alarm and battery back-up is installed on the floor level where the gas equipment is to be installed, in addition, the installing plumber or gas fitter shall observe that a battery operated or hard-wired carbon monoxide detector with an alarm is installed on each additional level of the dwelling, building or structure served by the side wall horizontal vented gas fueled equipment. It shall be the responsibility of the property owner to secure the services of qualified licensed professionals for the installation of hard-wired carbon monoxide detectors.

   a. In the event that the side wall horizontally vented gas fueled equipment is installed in a crawl space or an attic, the hard-wired carbon monoxide detector with alarm and battery back-up may be installed on the next adjacent floor level.

   b. In the event that the requirements of this subdivision cannot be met at the time of completion of installation, the owner shall have a period of thirty (30) days to comply with the above requirements; provided, however, that during said thirty (30) day period, a battery operated carbon monoxide detector with an alarm shall be installed.

2. APPROVED CARBON MONOXIDE DETECTORS. Each carbon monoxide detector as required in accordance with the above provisions shall comply with NFPA 720 and be ANSI/UL 2034 listed as IAS certified.

3. SIGNAGE. A metal or plastic identification plate shall be permanently mounted to the exterior of the building at a minimum height of eight (8) feet above grade directly in line with the exhaust vent terminal for the horizontally vented gas fueled heating appliance or equipment. The sign shall read, in print size no less than one-half (1/2) inch in size, “GAS VENT DIRECTLY BELOW. KEEP CLEAR OF ALL OBSTRUCTIONS.”

4. INSPECTION. The state or local gas inspector of the side wall horizontally vented gas fueled equipment shall not approve the installation unless, upon inspection, the inspector observes carbon monoxide detectors and signage installed in accordance with the provisions of 248 CMR 5.089(2) (a) 1 through 4.

(b) EXEMPTIONS. The following equipment is exempt from 248 CMR 5.089(2)(a) 1 through 4.

1. The equipment listed in Chapter 10 entitled “Equipment Not Required To Be Vented” in the most current edition of NFPA 54 as adopted by the Board; and

2. Product Approved side wall horizontal vented gas fueled equipment installed in a room or structure separate from the dwelling, building or structure used in whole or in part for residential purposes.

(c) MANUFACTURER REQUIREMENTS – GAS EQUIPMENT VENTING SYSTEM PROVIDED. When the manufacturer of Product Approved side wall horizontally vented gas equipment provides a venting system design or venting system components with the equipment, the instructions provided by the manufacturer for installation of the equipment and the venting system shall include:

1. Detailed instructions for the installation of the venting system design or the venting system components; and

2. A complete parts list for the venting system design or venting system.

(d) MANUFACTURER REQUIREMENTS – GAS EQUIPMENT VENTING SYSTEM NOT PROVIDED. When the manufacturer of a Product Approved side wall horizontally vented gas fueled equipment does not provide the parts for venting the fuel gases, but identifies “special venting systems,” the following requirements shall be satisfied by the manufacturer.

1. The referenced “special venting system” instructions shall be included with the appliance or equipment installation instructions; and

2. The "special venting systems" shall be Product Approved by the Board, and the instructions for that system shall include a parts list and detailed installation instructions.

(e) A copy of all installation instructions for all Product Approved side wall horizontally vented gas fueled equipment, all venting instructions, all parts lists for venting instructions, and/or all venting design instructions shall remain with the appliance or equipment at the completion of the installation.
Congratulations on your Town & Country purchase

Your Architectural Series Zero Clearance linear appliance has been professionally installed by:

Dealer name: _____________________________________________

Phone Number: ___________________________________________

If you discover any problems with your linear appliance, contact your dealer immediately to have the unit repaired.

Caution: Do not attempt to repair the linear appliance because you may cause injury to yourself or others, and risk causing damage to the unit.

Before operating your linear appliance carefully read this manual and pay close attention to all Safety Warnings. The manual contains important information on the unit's safe operation and maintenance.

--- Installation Requirements/Appliance Specifications ---

Specifications

- This unit has been tested to ANSI Z21.50 and CSA P.4.1 specifications.
- Single wall (min. 26 ga) galvanized venting. (Zero clearance)
- 120VAC / single phase.
- 24VAC Honeywell direct ignition valve system.
- Power vented only. Programmed with pre and post-purge safety functioning. Certified to use provided Town & Country power vent only.
- Horizontal or Vertical Termination.
- Zero clearance unit (no non-combustible board required).
- 12” rigid exhaust - 150ft max length plus up to 6 elbows. (Zero clearance)
- 7” rigid intakes - (All bottom intake models) 150ft max length plus up to 6 elbows. (Zero clearance)
- 12” or 14” rigid intakes - (All top intake models) 150ft max length plus up to 6 elbows. (Zero clearance)
Installation Requirements

The fireplace installation and venting must conform to the current CAN/CGA-B149 installation code (in Canada) or the current National Fuel Gas Code, ANSI Z223.1 (in the USA), and approved per local codes. Only qualified (licensed or trained) personnel should install this product.

In the state of Massachusetts, only a licensed Plumber and Gas Fitter may install this product.

Vent Terminal Minimum Clearances

Refer to the Power Vent installation instructions which are included with the power vent.

Minimum Clearances to Combustible Material

This appliance is a zero clearance fire feature. Combustible material may be use to frame the unit in.

Venting for this unit is also zero clearance. Combustible material is permitted to come into direct contact with venting material.

Locating the Unit

The Architectural Series Linear Appliances are power vent only, and because of this, they can be located in a variety of places. Consideration must be taken for the location of the fresh air intake and the power vent unit venting. A site fabricated platform capable of supporting the appliances weight may be constructed to elevate the viewing area to the desired height, as well as accommodate the fresh air intake - (if bottom vented), gas supply and electrical supply.

Figure 1: Linear appliance location options.
Upper Support for Light Framed Units

The Peninsula is built using either a light weight material or heavy weight material. The difference between the two is determined by the weight of the facing material to be used. The lighter Peninsula uses adjustable supports to support the upper section of the Peninsula so that its’ weight does not distort the upper section of the Peninsula.

Materials included for this support include:
- Eight 6’ threaded rods - four right hand thread and four left hand thread (Figure 2).
- Four Turnbuckles (Figure 3).
Removing Vertical Supports

Peninsulas built with a light frame ship with two vertical supports attached to the open end as shown in Figure 5 so that the weight of the upper section of the fireplace does not distort the upper section. These supports must remain in place until:

- The Peninsula is in its final location.
- The Upper Support Frame is in its final location.
- The adjustable turnbuckles and their threaded support rods have been set so that the upper section of the Peninsula is no longer exerting weight on the vertical supports.

Once the weight of the upper section is fully supported by the adjustable support rods, the vertical supports can be removed.

To remove:

Locate the bolts securing the vertical supports to both the upper and lower sections of the Peninsula (Figure 6 and Figure 7).

Use a 9/16” socket wrench to remove.

Discard vertical supports once they have been removed.
Before framing and finishing, there are two important points to keep in mind:

1. When securing wooden studs to the top of the unit, the screws can be secured through any part of the upper fastening area surface (Figure 8).

2. Facing material can be secured directly to the front and sides of the unit except in the areas indicated in this example in (Figure 9). Each model will have its own specific areas in which screws must not be driven into.

Facing material may be screwed directly into the body of the appliance with the exception of areas indicated.

Figure 8: Stud securing points.

Figure 9: Facing attachment area.
To reduce vent noise, it is recommended to insulate the chase above the fireplace with soundproof insulation.

Framing in the unit begins with determining how high from the floor the unit will sit. A platform capable of supporting the weight of the unit and, if bottom air intake style, housing the fresh air intake venting must be built. Standard 2X4”s or 2X6”s can be used for building the frame at the bottom of the unit and 2X4”s can be used for building the frame at the top of the unit (Figure 10).

On the top of the unit, a pony wall can be built to the ceiling if desired. This pony wall will also accommodate the exhaust venting material. Both supporting structure and pony wall must be tied into wall framing.

The building of the supporting structure and the pony wall must be built to local building codes.
Facing Material

Because the appliance requires no clearance to combustible material, drywall or other facing material can be affixed directly to the surface of the unit. Using standard 2x4’s and 2x6’s in the framing process allows for the edge of 1/2” drywall or other facing material to fit into the channels which make up the perimeter of the exterior glass sheets (Figure 11 and Figure 12).

Figure 11: Leading edge of drywall.

Figure 12: Left side framing and facing view.
Venting Configuration

Maximum flue outlet pipe length is 150 feet plus 6 elbows.
Maximum combustion air inlet pipe is 150 feet plus 6 elbows.

Flat roof configuration
Peaked roof configuration
Surface mount power vent
Riser required (Min. 12" high. Check local codes).

Figure 13: Venting configurations.

Venting plenum

NOTE: Plenum must not be shared with other appliances.

Some installations - particularly in new renovations or with pre-existing constraints / obstacles may require the construction of a plenum in order to accommodate multiple air intakes.

The plenum must be made of furnace ducting (Minimum 26 gauge) or other material impervious to moisture. The constructed plenum must have a minimum cross-section of 150 square inches and be sealed to the air-intake collars on the appliance. The plenum may be transitioned to a single intake as long as the 150 square inch cross-section is maintained.

For a single air intake, the rule of a maximum of 150 feet plus 6 elbows still applies.
Various venting configurations are possible, giving versatility to installations.

All venting including exhaust is zero clearance to combustible materials.

Must use 12” intake venting lines. Each venting line can be a maximum of 150ft plus 6 elbows.

For servicing purposes, it is recommended that, if possible, the optional motorized dampers be accessible after installation.

Fresh air intakes can be joined into a larger single duct or plenum. (Minimum 150 in² cross-section)

Figure 14: Venting specifications.

- Air intake venting uses 12” standard single wall furnace grade venting material. The intake line can be up to a maximum of 150 ft plus 6 elbows.

- Motorized damper is optional.

- Exhaust venting uses 12” standard single wall furnace grade venting material. Maximum length is 150 ft plus 6 elbows.

- All Venting is zero clearance.
The optional motorized damper closes off air from the outside being able to enter the fireplace when the fireplace is off. This unit is mounted near the air intake vent. This unit is wired directly to the fireplace body (Figure 62 on page 36). One motorized damper is required for each of the air intake venting lines.
We recommend attaching this collar as close to the power vent as possible to reduce vibration from the power vent through the vent pipe.

Use the provided self-tapping screws to attach the vent pipe to both sides of the anti-vibration collar.

Use the provided lag screws to attach the power vent to the site constructed riser or curb. There are 8 holes around the base. (Two per side).
Power Vent Dimensions

Figure 21: Power vent vertical installation.
Figure 22: Power vent horizontal installation.

When installing the power vent horizontally, ensure the side of the power vent with the attached electrical junction box is facing downwards.

Use exterior silicone/caulk around the base of the power vent to seal it to the building envelope.

Any horizontal run leading to the power vent shall be sloped down to the outside at a minimum of 1/4 inch per foot of vent length.
Note: Minimum 3 feet clearance from solid objects/walls or between multiple power vents.

Figure 23: Power vent clearances.

Attach the anti-vibration collar as close to the power vent as possible.

Figure 24: Power vent pipe and collar assembly.
Power Vent Wiring

Figure 25: Junction box

Figure 26: Junction box with cover removed.

Figure 27: The black wire labeled 1-ONE is the load wire. The black wire labeled 2-TWO is the common wire.

Figure 28: Wiring completed.

Figure 29: Wiring diagram

When installing the power vent horizontally, ensure the side of the power vent with the attached electrical junction box is facing downwards.
Flush Mount Power Vent Details

115 VAC Single phase
60/50 Hz
1/2 HP
6.8 Amps
Weight: Aprox. 30 lbs.

Flush Mount Power Vent Dimensions

Figure 30: Architectural series power vent dimensions.
Mounting the Flush Mount Power Vent

The Architectural Series Power Vent must be mounted into a constructed frame. The size of the unit (28” x 28”) means that part of a stud will need to be removed in order to build the frame.

Before installing the fan into the frame, the front grill must be removed so an electrical connection can be established.

Removing the grill

The front grill must be removed before installing the unit into its frame. Locate and remove the four screws affixing the grill to the unit (Figure 31) - remove grill and set aside.

Installing the fan unit

The fan unit weighs approximately 30 lbs and so the constructed frame must be able to support its weight.

The fan unit is secured to the constructed frame using the 12 supplied screws (Figure 32).

Note: The constructed frame must be built in accordance with local building codes.

Minimum Clearances to Combustibles

Body of Power Vent: 0”

Vent pipe: 0”
Recommended framing. See local building codes for more information.

Figure 33: Fan - without grill, installed.
Flush Mount Electrical Connection

Note: Ensure that the power is disconnected at its source before proceeding.

The fan unit operates using 120VAC supplied from the fireplace. Once the fan unit is secured to its frame, the power line can be brought in from the rear of the unit. Be sure that the plastic grommet is installed in the hole where the power line is coming through (Figure 34).

Strip the three wires and secure to the control module as shown in Figure 35.

Once the power line has been secured, tighten the strain relief at the rear of the unit so that there is no undue stress on the power line (Figure 36).

Note: The control module has a speed variation adjustment which has had the knob removed (Figure 37). The fan speed has been set during the manufacturing process and must not be adjusted in the field.
The air baffle (Figure 38) is set to fully open before it is shipped and might need adjustment. However, if adjustment is required, the sliding plates can be moved by inserting a screwdriver or other object up through the baffle cover (Figure 39) and adjusted. There is a bracket on either end of the baffle to use for easy adjustment. If the flame pattern is too hectic, close the baffle opening a half inch at a time and monitor the flame with all glass panes installed.

**NOTE:** The more you close the baffle, the more the outer glass temperature will rise, as less heat is being evacuated from the combustion zone.

The baffle cover is secured by twelve bolts (Figure 39). If removal of the baffle cover is necessary, always remove the center bolts last, as well as installing them first when re-installing the baffle cover.
Burner tray installation

The burner tray consists of 3 pieces - 2 identical long pieces and one small patch piece.

1. The 2 long pieces fit on either side of the burner element.
2. Fit the edges of the long pieces fully into the slots as indicated in the inset of Figure 41.
Applying glass media

1. Apply glass media evenly throughout the burner tray. The layer of crushed glass should be applied so that the burner tray and the burner holes are just obscured.

2. Make sure that the first several holes underneath the flame igniter/rectifier are left uncovered as shown in Figure 45.

3. Do the same with the second long piece.

4. Place the small square patch over the hold at the opposite end from the pilot (Figure 42).

5. Use one screw each to secure the 2 long pieces and the one small patch (Figure 43).
Window Frame Installation/Removal

Once the crushed glass media has been placed over the burner tray, mount the 3 inner glass sheets and 3 outer glass sheets.

**Note:** Installing the long glass sheets in Peninsula models of 5 feet in length or greater is a two person job.

1. Before installing the glass sheets, push the gas valve shut-off handle down and out of the way (Figure 46).

2. Using the supplied suction handles, install the first inner long glass sheet, top edge in first as shown in Figure 47. Once top edge is in place, maneuver the bottom edge of the glass sheet so that it lines up with its corresponding channel. Lower the glass sheet into the channel. Repeat this procedure for the opposite long, inner glass sheet. Gently shift each of the long inner glass sheets toward the end the Peninsula opposite of the pilot assembly.
3. Install the inner end glass sheet by inserting the top edge of the glass sheet into its channel first, followed by lowering the bottom edge into its channel. **NOTE:** the inner end glass sheet should be centered so that the two long inner glass sheets cover the side edges of the inner glass sheet.

4. Once the three inner glass sheets are installed, place the two magnetic covers against the magnets on the side walls between the inner and outer glass sheets. Install the bottom end in first and rotate the cover up until the cover makes contact with the magnets (Figure 51 and Figure 52).

5. The installation of the outer sheets follow the same process as the installation of the inner glass sheets.

6. For de-installation, follow the previous procedures in reverse order.
There are two rows of LED lights in this fire feature, one row on each side of the burner. Each row of LED lights is made of individual LED sections which can be joined together using bridge connectors to achieve the desired row length (Figure 54). Each row of sections also has its own main electrical connector (Figure 55).

Removing an LED section

1. To remove an individual LED section or sections, begin by disconnecting the main power to the fire feature at the main circuit breaker. Give time for the unit to cool down.

2. Remove the glass panels.

3. Remove the glass media and the relevant glass tray.

4. Disconnect the main electrical connection located on the left hand side of the fire feature by lifting the connector up as shown in.
5. Remove the bridge connector of the LED section(s) to be replaced (Figure 56). These connector tabs lift up much like the main electrical connector. In this way, individual LED sections can be replaced without removing the entire row of LED sections from the fire feature.

6. The LED sections and rows are held in place by hold down tabs (Figure 57). These tabs can be lifted up so that the LED section can be removed.

7. When removing an individual LED section, lift up the side of the LED section next to the tabs that were just moved upwards and then remove the LED section (Figure 58).

NOTE: When replacing an LED section, make sure that the arrows on the sections meet as shown in (Figure 59). Whether joining full sized sections to other full sized sections, or when joining a full sized section to a short section, the arrows must meet each other. As you stand in front of the fire feature, the arrows will be located on the sides of the sections furthest away from you.

8. Reconnect the individual LED sections using a bridge connector as shown in (Figure 56).

9. Reconnect the main electrical connector as shown in (Figure 55).

10. Return the glass tray(s), glass media and glass panels to their original positions.
Power to this unit is 120VAC. The electrical connection boxes are located behind a removable panel that runs the length of the lower side of the appliance. After the panel is removed, the electrical connection box cover can be removed to access the wiring. Once wiring is completed (Figure 60), power will be supplied to both the power vent and the main unit control module (Figure 60 and Figure 61).

The optional motorized dampers wiring is located behind the removable panel as well under the square cover (Figure 62). There will be a pair of wires for the appropriate number of dampers specified for the appliance. The CAT 5e cable is located here as well. Connect the Cat 5e cable to the control panel wall receptacle (Figure 69 on page 39). Ensure the wiring strain relief clamps are snug and secure.

Re-attach the box covers, followed by the compartment panel when all wiring is complete.
Figure 63: Wiring diagram.
Control Panel Installation

Installation instructions

NOTE: The CAT5 cable has a maximum length of 50 feet and so the touch pad must be installed within this distance.

NOTE: Make sure that the touch pad is fully charged and its ON/OFF switch is in the ON position before mounting the touch pad in its frame.

NOTE: Make sure that the AC power to this appliance is turned off before installing the touch pad.

Place touch pad frame template at desired point against drywall. Use a level to finalize the template position (Figure 64).

1. Mark the inside of the template with a pencil (Figure 65).

2. Cut out the touch pad frame opening along the pencil mark (Figure 66).

Figure 64: Leveling the template.

Figure 65: Drawing the cut out.

Figure 66: Cutting out the panel opening.

Figure 67: Opening ready for panel frame.
Warning. Ensure that electrical power to the fire feature is disconnected before proceeding.

1. Bring one end of the CAT5 cable out through the opening from behind the drywall (Figure 68).
2. Plug the CAT5 cable into the touch pad frame as shown in Figure 69.
3. Orient the touch pad frame as shown in Figure 70 and place the frame into the opening and firmly seat.

NOTE: The BlueTooth PIN code is located on its board. Take note of the code before mounting the touch pad in its frame.
1. There are 2 locking tabs - one on the lower left hand corner and one on the upper right hand corner of the touch pad frame. Using a screw driver, rotate the locking tab from the unlocked position (Figure 71) to the locked position and tighten the screw (Figure 72). The tabs will now be behind the drywall securing the touch pad frame in place.

2. Plug the black connector into the touch pad (Figure 73). The connector should be on the left hand side of the frame as it is inserted into the frame. **NOTE: Turn the touch pad ON before installing it into the frame.**

Figure 71: Securing tabs in unlocked position.  
Figure 72: Securing tabs in locked position.  
Figure 73: Connecting the touch pad.
1. Place the touch pad into the frame. There are 4 touch pad holding tabs which will hold the touch pad in place (Figure 74).

![Figure 74: Touch pad holding tabs.](image)

![Figure 75: Touch pad in frame.](image)
2. Finish by placing the face plate over the touch pad. The face (Figure 76).

NOTE: The touch pad frame has a room temperature sensor (Figure 75) which will shut the system down if the room temperature exceeds 40°C / 104°F.

There is also a system disable switch (Figure 75) which turns off the appliance until such time that it is turned back on. Both the room over-temperature sensor and the system disable switch are accessible with the face plate in place.
Gas Connection

All units ship with a multi-capped half inch NPT pipe for gas connection (Figure 77).

All units also ship with a gas valve shut-off (Figure 78). This shut-off handle is located in the opening between the inner and outer glass panes. Push this handle down before installing the outer glass panes.

**LIGHTING INSTRUCTIONS**

1. **STOP!** Read the safety information above this label.
2. Move switch to “ON” position (unit will purge for 10 seconds).
3. The appliance will try igniting 3 times. If the appliance fails to ignite, the control will lock out.
4. Call your service technician or retailer to rectify the issue.

**TO TURN OFF GAS APPLIANCE**

1. Move switch to the “OFF” position (unit will post-purge for 15 seconds).
2. Turn off all electrical power to the appliance if service is to be performed or for extended shutdown.

**CAUTION:** Hot while in operation. Do not touch. Severe burns may result. Keep children, clothing, furniture, gasoline and other liquids having flammable vapours away. Keep burner and control compartments clean. See installation and operating instructions accompanying the appliance.

**Maintenance**

**CAUTION:**

Turn off gas and electrical power supply (if applicable) and allow ample time for unit to cool before servicing appliance. It is recommended that the fire feature and its venting be inspected at least once a year by a qualified service person.

**GLASS PANEL:**

Warning: Do not operate fire feature with glass panel removed, cracked or broken. Replacement of the glass panel should be done by a licensed or qualified service person.

Do not strike or otherwise impact the glass in anyway that may cause it to break. If the glass becomes cracked or broken it must be replaced before using the fire feature. Replacement glass can be obtained from your nearest Town & Country Fireplaces dealer.

**ANNUAL INSPECTION:**

a) Remove glass panel and inspect the Burner and Igniter for soot build up. If excessive build up of soot is present, have a qualified service person inspect and adjust the unit for proper combustion.

b) Check that the venting pipe and venting terminal are open and free from blockage or debris. If the venting is disassembled for cleaning, it must be properly assembled and re-sealed. Refer to VENTING section for proper procedure.

**Note:** The appliance area must be kept clear and free from combustible materials, gasoline and other flammable vapours and liquids.

**Periodically:**

a) Viewing glass may be cleaned as necessary with fireplace glass cleaner.

**CAUTION:**

Do not use abrasive cleaners on glass or any other part of the fire feature.

Do not clean glass when hot.
